

**Some people think that instead of preventing climate change, we need to find a way to live with it. To what extent do you agree or disagree?**

Due to various human activities, the climate of the earth has never stopped changing, which has led to a series of environmental challenges, such as the rising global temperature and increasing floods. In my opinion, exploring new ways to live with climate change and preventing it becoming worse are equally important.

On the one hand, because climate change has caused a series of grave problems, such as more droughts and rainstorms which cannot be solved or reversed in a short period of time, we have to react immediately to ensure human's normal life and even survival by advancing technologies. For instance, if heat-resistant crops were not researched and developed, the decline in crop yields would lead to a severe shortage of food, which will be possibly followed by a life-threatening famine. Therefore, continuous studies on tackling the harmful consequences of climate change are needed.

On the other hand, I also believe that there is a crucial need for us to stop the climate from deteriorating continuously since there will be one day when adapting to the changing climate is almost impossible for human

beings. If we tolerated the deterioration of the climatic conditions, our survival would be threatened when the development of technology reaches its limitation. For example, although more heat-resistant crops can survive the rising temperature currently, they will not be able to grow and fruit when the temperature exceeds 100 degree Celsius.

In conclusion, I believe that not only should we improve our everyday existence in the changing climate to prepare for potential threats, but we ought to invest time and money in slowing down or even ending the process of climate change as well.
